

Fall Protection – Safety Monitoring Systems

No equipment is required for this Fall Protection method.
People are the key element.

Safety Monitoring Systems involves the use of **Competent Persons** who are knowledgeable about fall hazards and have the authority to take action to eliminate them.

This method can be used on low sloped roofs and incorporated into a fall protection plan (FPP) for work on leading edges, pre-cast or residential construction.

On low sloped roofs this system must also have a **Warning Line System** in place unless the roof is 50 feet wide or less.

Employers must designate a monitor who has no other responsibilities but to monitor for fall hazards on the same level as the work being performed within visual and verbal communication distance to recognize hazards and warn workers.
